

CS F212

Database Systems - Assignment

Semester II 2017-18

BITS Pilani
Dubai Campus

Topic : Restaurant Management System

Group members :

Parth Poply	2016A7PS0249U
Sujith Sizon	2016A7PS0277U
Somil Mathur	2016A7PS0271U
Jaskanwar Singh	2016A7PS0075U
Tushar Agarwal	2016A7PS0080U

Objective of the project :

The main objective of the project is to develop a database on a restaurant management system. By using this project, students get a clear idea of how the database works and how they can use it. Also by working on this project students are able to understand the use and retrieval of databases in general.

Purpose/Relevance of the project :

A Database Management System is a system software for creating and managing databases. The DBMS provides the users and programmers with a systematic way to create, retrieve update and manage data.

The project on Restaurant Management system helps to understand how databases work in restaurants. Every restaurant has many entities and each entity has many attributes. By identifying the entities, attributes, and relations in the restaurant management system it would ease the task of working on the database.

Need for Restaurant Management System ?

People are different as are restaurants. By producing meal experiences with unique characteristics, restaurants cater for the needs of specific customer categories. A look at the restaurant market of a city gives

a fascinating illustration of the culture and diversity of that city.

From an economic point of view, this diverse supply of meal experiences is perfectly rational when the demand is equally diverse and customers are prepared to pay a premium price for the extra; be it an extra service experience, an extra culinary experience or an extra aesthetic experience of an elegant dining room.

A problem in an economic context, as often in economics, is information. Restaurant managers must not only know the preferences and the needs of their customers, but also allocate resources in a way that makes it possible to produce the particular meal experiences that their customers expect.

Accounting systems provide an instrument for budgeting and for an efficient allocation of resources. A restaurant manager must be aware of the fact that customers normally do not come only to eat, but come for a multidimensional experience and restaurant managers should, therefore, plan and budget multidimensionally. Accounting systems provide information about goal achievement and signals for management control. A multidimensional budget will force managers to follow up activities in detail and assess whether resources efficiently perform or support the specific activities they are allocated to. Traditional management control is concerned with cost of resources, e.g. food cost and cost of labour, whether management control related to customer experiences should be concerned both with the cost of resources and the value of the meal experience created for the customer.

Accounting systems also provide necessary information for cost-based pricing. The price charges the customer for the cost of producing a meal experience. Traditionally, restaurant managers determine a cost-based mark-up price by adding 150–300 per cent overhead charges on the food cost. Apart from the fact that this practice ignores the value of the customer experience, it can, from a theoretical point of view, be criticised for a number of reasons.

Identification of Entities :

1. Restaurant
2. Cashier
3. Bill
4. Manager
5. Customer
6. Chef
7. Waiter
8. Item
9. Order

Identification of Attributes :

1. **Restaurant** : Name, Ph. No. , Address
2. **Cashier** : Bill No. , Name , Txn ID
3. **Bill** : Order Detail, Bill No. , Amount , Customer ID
4. **Manager** : Manager ID , Name , Ph. No.
5. **Customer** : Name , Ph. No. , Address , Customer ID
6. **Chef** : Name , Chef ID
7. **Waiter** : Name , ID
8. **Item** : Item No. , Amount , Quantity , Description , Order No.
9. **Order** : No. Of Items , Order No.

Identification of Relations :

1. Restaurant HAS A Manager
2. Restaurant HAS A Cashier
3. Bill PAID TO Cashier
4. Manager TELLS Chef
5. Manager TAKES Order
6. Customer PLACES Order
7. Customer PAYS Bill
8. Waiter BRINGS Order
9. Waiter DELIVERS TO Customer
10. Chef PREPARES Order
11. Order CONTAINS Item

ER diagram :

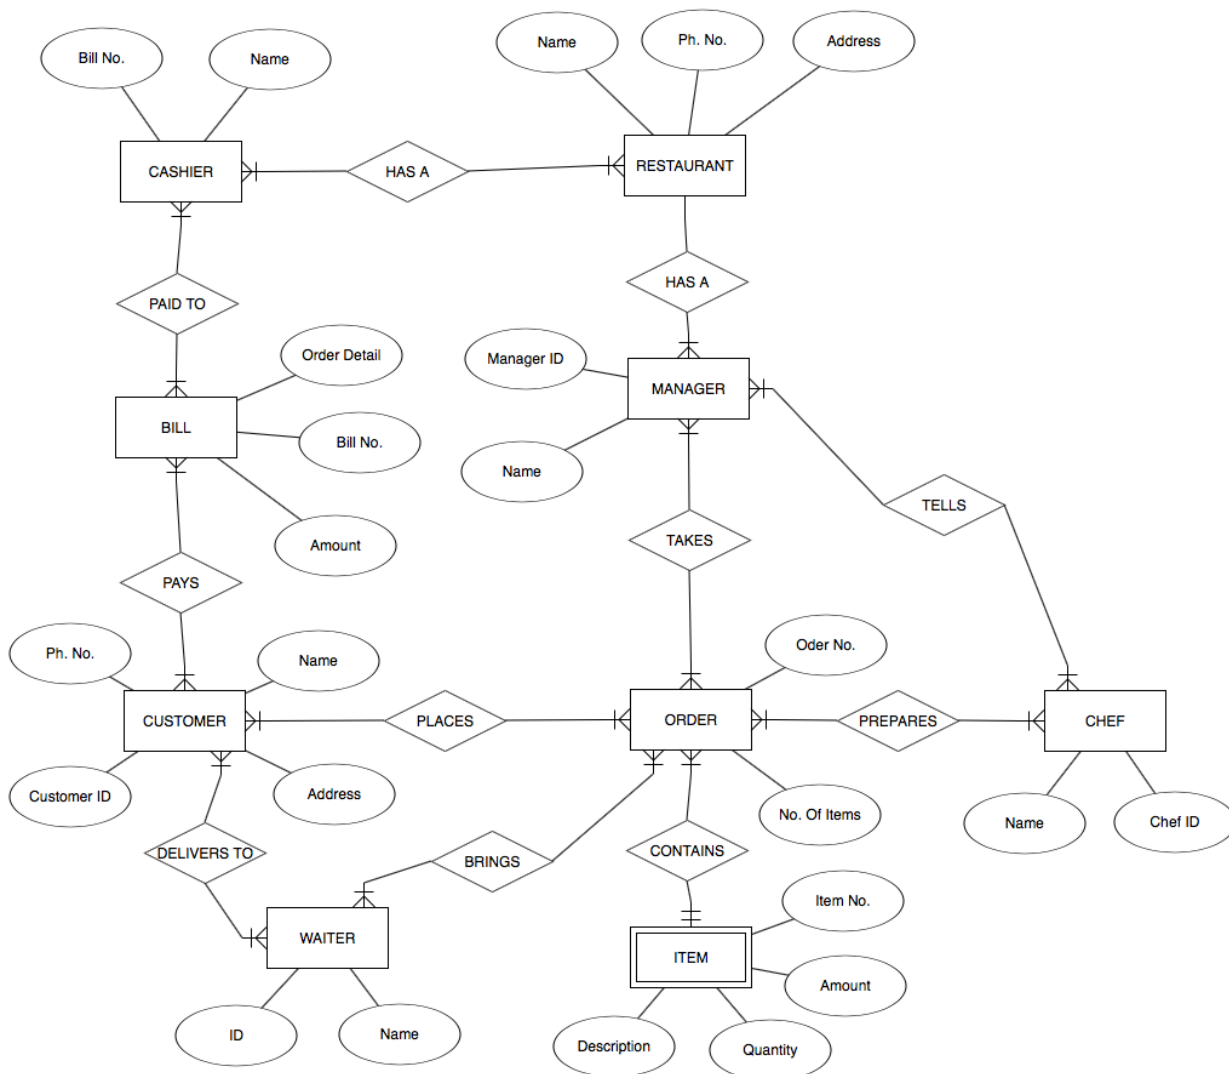

Fig : ER diagram for Restaurant Management System (made using ERDPlus.com)

Relational model :

(Pre - Normalisation)

Tables :

1. Restaurant (Name, Ph. No. , Address)
2. Cashier (Bill No. , Name , Txn ID)
3. Bill (Order Detail, Bill No. , Amount , Customer ID)
4. Manager (Manager ID , Name , Ph. No.)
5. Customer (Name , Ph. No. , Address , Customer ID)
6. Chef (Name , Chef ID)
7. Waiter (Name , ID)
8. Order (Item No. , Amount , Quantity , Description , No. Of Items , Order No. , Customer ID)

Normalisation :

1)

Table Restaurant (Name, Ph. No. , Address)

Functional dependencies :

Ph. No. \rightarrow Name , Address

Normal form : Already in 3NF (no need for decomposition)

2)

Table Cashier (Bill No. , Name , Txn ID)

Functional dependencies :

Txn ID \rightarrow Name , Bill No.

Normal form : Already in 3NF (no need for decomposition)

3)

Table Bill (Order Detail, Bill No. , Amount , Customer ID)

Functional dependencies :

Bill No. \rightarrow Order detail , Amount , Customer ID

Normal form : Already in 3NF (no need for decomposition)

4)

Table Manager (Manager ID , Name , Ph. No.)

Functional dependencies :

Manager ID \rightarrow Name, Ph. No.

Normal form : Already in 3NF (no need for decomposition)

5)

Table Customer (Name , Ph. No. , Address , Customer ID)

Functional dependencies :

Customer ID \rightarrow Name , Address

Ph. No. \rightarrow Name , Address

Normal form : Already in 3NF (no need for decomposition)

6)

Table Chef (Name , Chef ID)

Functional dependencies :

Chef ID \rightarrow Name

Normal form : Already in 3NF (no need for decomposition)

7)

Table Waiter (Name , ID)

Functional dependencies :

ID \rightarrow Name

Normal form : Already in 3NF (no need for decomposition)

8)

Table Order (Item No. , Amount , Quantity , Description ,
No. Of Items , Order No. , Customer ID)

Functional dependencies :

Order No. \rightarrow No. Of Items , Description , **Item No.** ,
Customer ID

Item No. \rightarrow Amount , Quantity , Description

There exists **transitive dependency** (through Item No.)

So decomposition is required .

Table Order can be Decomposed to :

Table Item (Item No. , Amount , Quantity , Description)
And

Table Order(Order No. , Item No. , No. Of Items ,
Customer ID)

New Relational Schema (after Normalisation and with primary keys) :

1. *Restaurant* (Name, Ph. No. , Address)
2. *Cashier* (Bill No. , Name , Txn ID)
3. *Bill* (Order Detail, Bill No. , Amount , Customer ID)
4. *Manager* (Manager ID , Name , Ph. No.)
5. *Customer* (Name , Ph. No. , Address , Customer ID)
6. *Chef* (Name , Chef ID)
7. *Waiter* (Name , ID)
8. *Order* (No. Of Items , Order No. , Item No. , Customer ID)
9. *Item* (Item No. , Order No. , Amount , Quantity , Description)

Table Creation/Insertions :

Query 1

```
1 create table restaurant (name varchar(50), phno int, address varchar(50), PRIMARY KEY (phno));
2 insert into restaurant values ('Gazebo',0556227426,'Business Bay, Dubai');
3 insert into restaurant values ('Al Madina',0551111111,'Academic City, Dubai');
4 insert into restaurant values ('Iris Dubai',0552222222,'Internet City, Dubai');
5 insert into restaurant values ('The Gallery',0553333333,'Internet City, Dubai');
6 insert into restaurant values ('Chillis',0554444444,'Business Bay, Dubai');
7
8 select * from restaurant;
```

Result Grid

name	phno	address
Gazebo	556227426	Business Bav. Dubai
Al Madina	551111111	Academic Ctv. Dubai
Iris Dubai	552222222	Internet Ctv. Dubai
The Gallerv	553333333	Internet Ctv. Dubai
Chillis	554444444	Business Bav. Dubai
HULL	HULL	HULL

Query 1

```
1 create table manager (managerID varchar(50), name varchar(50), phno int, PRIMARY KEY (managerID),
2 FOREIGN KEY (phno) REFERENCES restaurant(phno));
3 insert into manager values (001, 'Parth Poply', 0556227426);
4 insert into manager values (002, 'Sujith Sizon', 0551111111);
5 insert into manager values (003, 'Somil Mathur', 0552222222);
6 insert into manager values (004, 'Jaskanwar Singh', 0553333333);
7 insert into manager values (005, 'Tushar Agarwal', 0554444444);
8
9 select * from manager;
```

Result Grid

managerID	name	phno
1	Parth Poolv	556227426
2	Suiith Sizon	551111111
3	Somil Mathur	552222222
4	Jaskanwar Singh	553333333
5	Tushar Aagarwal	554444444

Query 1

```
1 create table customer (name varchar(50), phno int, address varchar(50), customerID int, PRIMARY KEY (customerID));
2 insert into customer values ('Ramu Singh',0556227421,'Business Bay, Dubai', 001);
3 insert into customer values ('Zachery Larson',0551111112,'Academic City, Dubai', 002);
4 insert into customer values ('Iris West',0552222223,'Internet City, Dubai', 003);
5 insert into customer values ('Barry Singh',0553333334,'Internet City, Dubai', 004);
6 insert into customer values ('Ayush Chamoli',0554444441,'Business Bay, Dubai', 005);
7 insert into customer values ('Piyush',0554444442,'Business Bay, Dubai', 006);
8 insert into customer values ('Rahul',0554444443,'Business Bay, Dubai', 007);
9 insert into customer values ('Anand',0554444444,'Business Bay, Dubai', 008);
10
11 select * from customer;
```

Result Grid

name	phno	address	customerID
Ramu Singh	556227421	Business Bav. Dubai	1
Zacherv Larson	551111112	Academic Ctv. Dubai	2
Iris West	552222223	Internet Ctv. Dubai	3
Barrv Singh	553333334	Internet Ctv. Dubai	4
Avush Chamoli	554444441	Business Bav. Dubai	5
Pivush	554444442	Business Bav. Dubai	6
Rahul	554444443	Business Bav. Dubai	7
Anand	554444444	Business Bav. Dubai	8

Query 1

```

1 create table bill (orderDetail varchar(50), billNo int, amount int, customerID int,
2 PRIMARY KEY (billNo), FOREIGN KEY (customerID) REFERENCES bill(customerID));
3 insert into bill values ('Hummus and Pita', 0001, 20, 001);
4 insert into bill values ('Shish Tawook', 0002, 30, 002);
5 insert into bill values ('Foul meddamas', 0003, 25, 003);
6 insert into bill values ('Baba ghanoush', 0004, 20, 004);
7 insert into bill values ('Hummus and Pita', 0007, 20, 007);
8 insert into bill values ('Falafel', 0005, 15, 005);
9 insert into bill values ('Cheese Manakisk', 0006, 20, 006);
10 insert into bill values ('Hummus and Pita', 0008, 20, 008);
11
12 select * from bill;

```

Result Grid

	orderDetail	billNo	amount	customerID
	Hummus and Pita	1	20	1
	Shish Tawook	2	30	2

210	106	20	1 Cheese Manakisk	Cheese Manakisk
211	108	10	1 Hummus	Hummus

Query 1

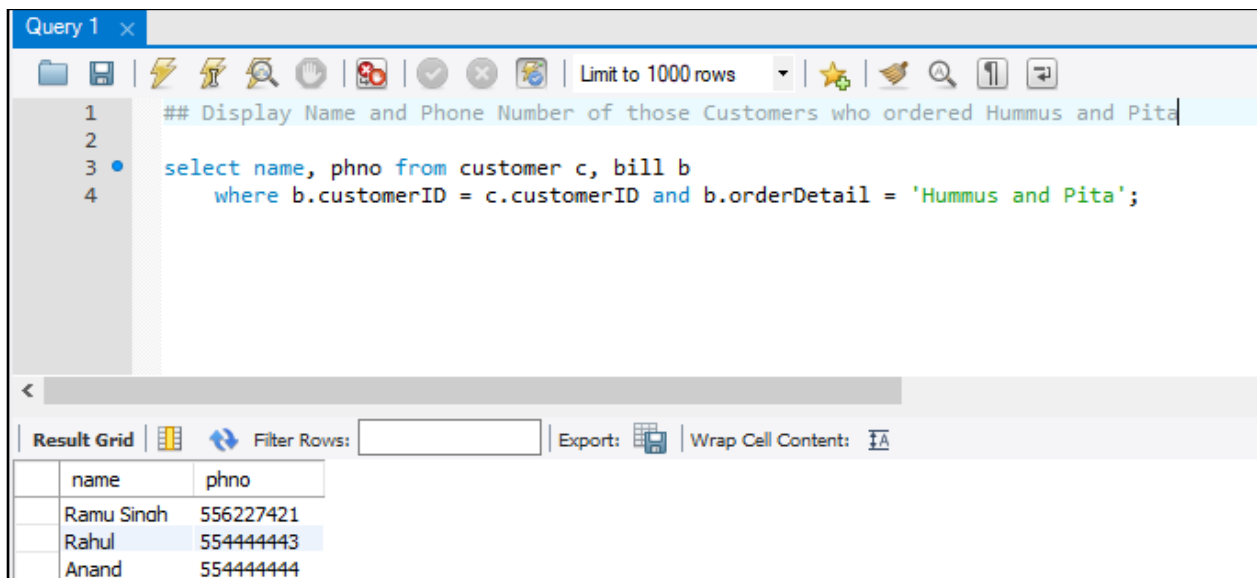

```

1 create table chef (name varchar(50), chefID varchar(50), PRIMARY KEY (chefID));
2
3
4 create table waiter (name varchar(50), ID varchar(50), PRIMARY KEY (ID));
5

```

Queries :

Display the Name and Phone Number of those Customers who ordered Hummus and Pita :

Query 1 x

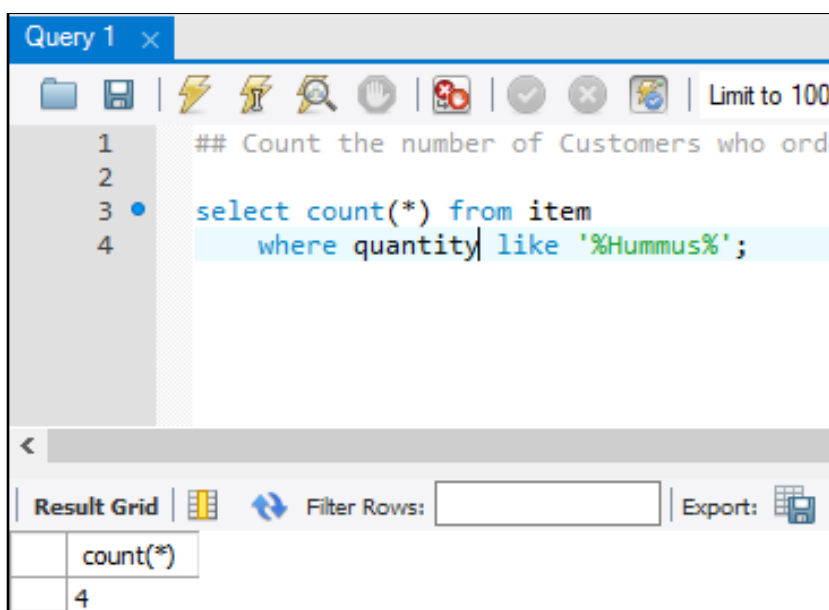

Limit to 1000 rows

```
1  ## Display Name and Phone Number of those Customers who ordered Hummus and Pita
2
3  • select name, phno from customer c, bill b
4      where b.customerID = c.customerID and b.orderDetail = 'Hummus and Pita';
```

Result Grid

name	phno
Ramu Singh	556227421
Rahul	554444443
Anand	554444444

Count the number of Customers whose order(s) included Hummus :

Query 1 x

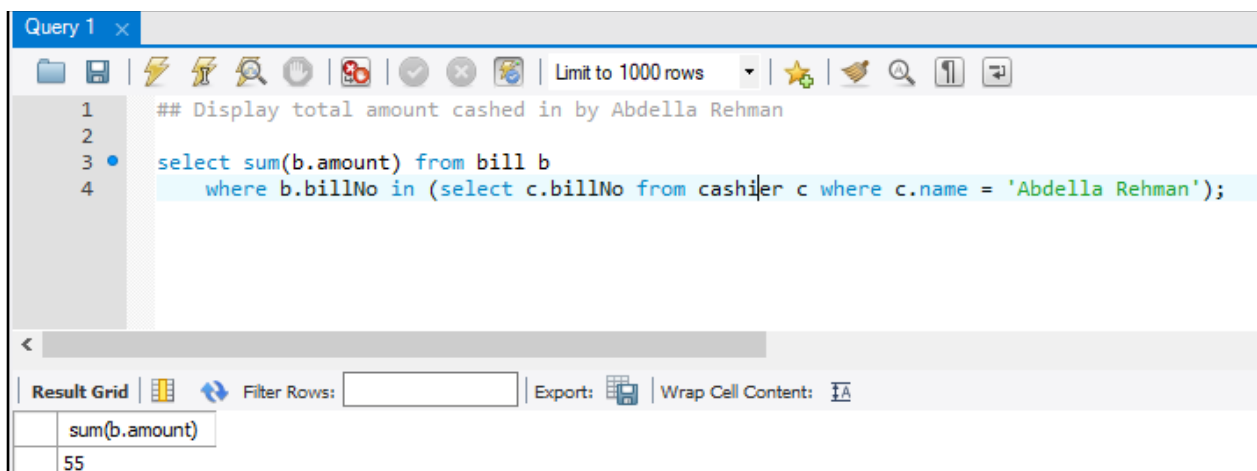

Limit to 100

```
1  ## Count the number of Customers who ord
2
3  • select count(*) from item
4      where quantity like '%Hummus%';
```

Result Grid

count(*)
4

Display total amount cashed in by Cashier Abdella Rehman :

Query 1 x

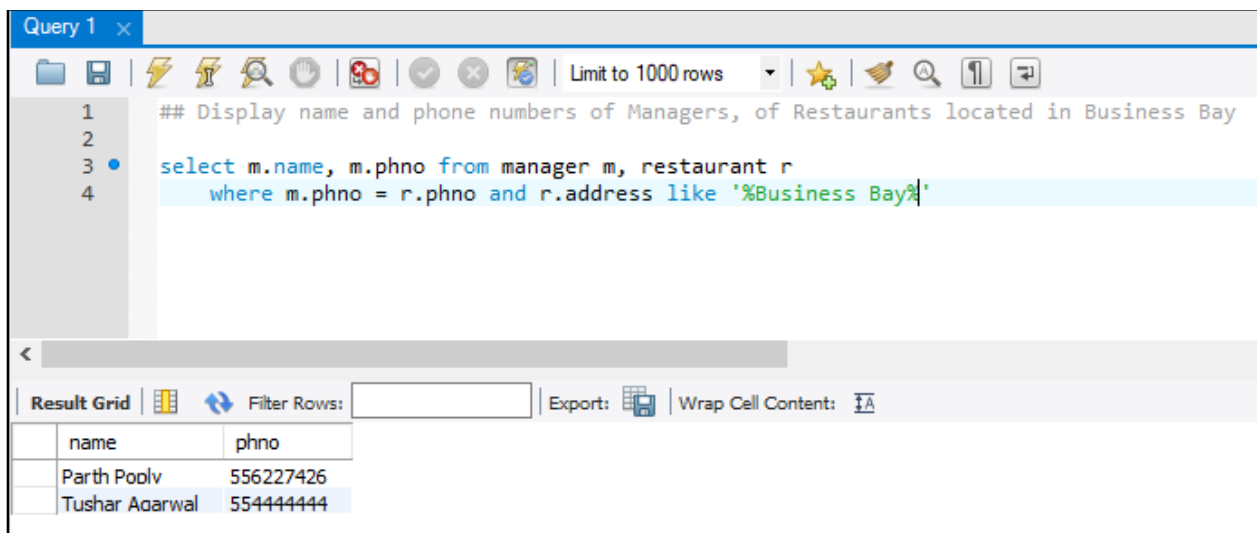

Limit to 1000 rows

```
1 ## Display total amount cashed in by Abdella Rehman
2
3 • select sum(b.amount) from bill b
4     where b.billNo in (select c.billNo from cashier c where c.name = 'Abdella Rehman');
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: |

sum(b.amount)
55

Display name and phone numbers of Managers of Restaurants located in Business Bay :

Query 1 x

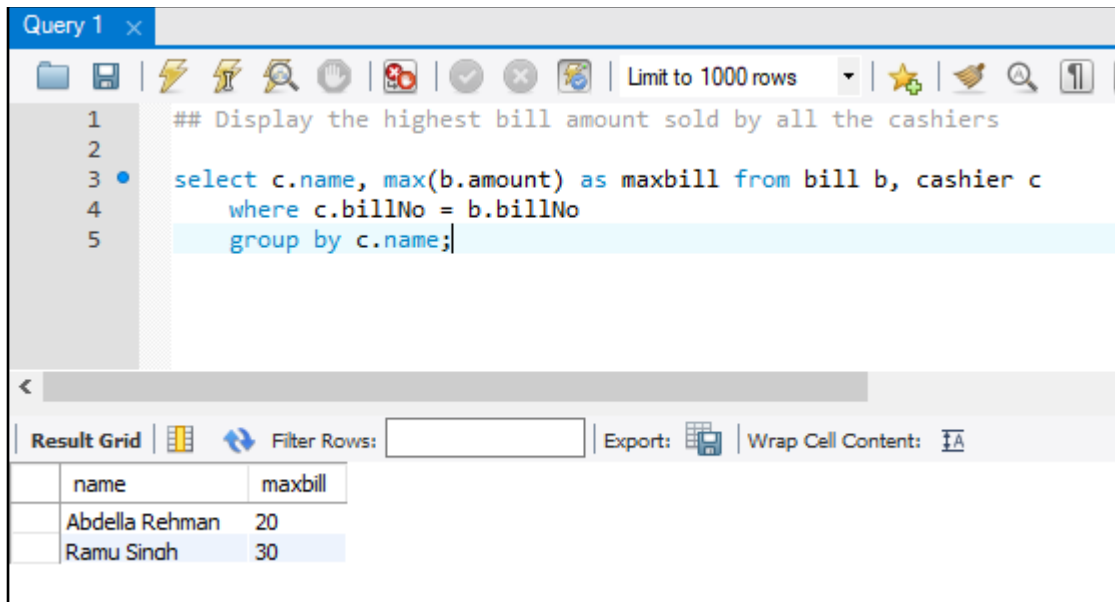

Limit to 1000 rows

```
1 ## Display name and phone numbers of Managers, of Restaurants located in Business Bay
2
3 • select m.name, m.phno from manager m, restaurant r
4     where m.phno = r.phno and r.address like '%Business Bay%'
```

Result Grid | Filter Rows: | Export: | Wrap Cell Content: |

name	phno
Parth Poolv	556227426
Tushar Aarwal	554444444

Display the max/highest bill amount sold by all the cashiers :

The screenshot shows a SQL query editor window titled "Query 1". The query is as follows:

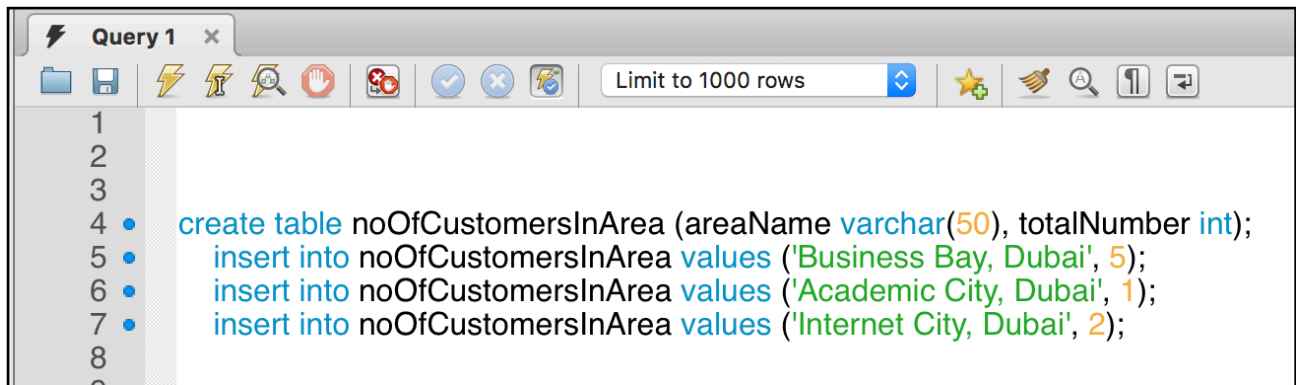

```
1  ## Display the highest bill amount sold by all the cashiers
2
3  select c.name, max(b.amount) as maxbill from bill b, cashier c
4  where c.billNo = b.billNo
5  group by c.name;
```

Below the query editor, there is a "Result Grid" section. It includes a "Filter Rows" input field, an "Export" button, and a "Wrap Cell Content" checkbox. The result grid displays the following data:

name	maxbill
Abdella Rehman	20
Ramu Singh	30

Triggers and Procedures :

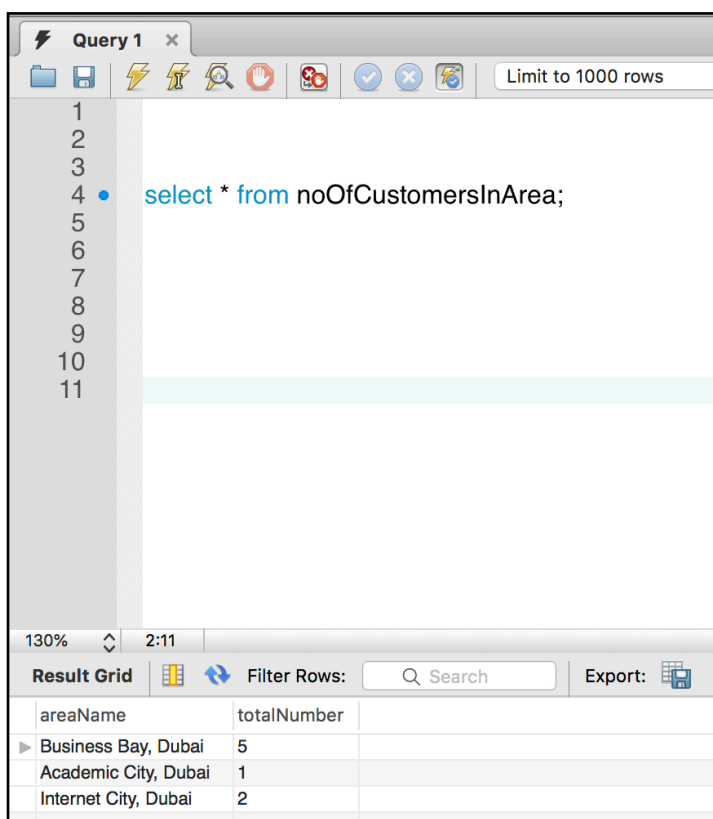

Creation of table for keeping record of customers from specific areas :

The screenshot shows a SQL query editor window titled "Query 1". The query text is as follows:

```
1  
2  
3  
4 • create table noOfCustomersInArea (areaName varchar(50), totalNumber int);  
5 • insert into noOfCustomersInArea values ('Business Bay, Dubai', 5);  
6 • insert into noOfCustomersInArea values ('Academic City, Dubai', 1);  
7 • insert into noOfCustomersInArea values ('Internet City, Dubai', 2);  
8  
9
```

The editor includes a toolbar with various icons and a "Limit to 1000 rows" dropdown menu.

The screenshot shows the same SQL query editor window with a new query:

```
1  
2  
3  
4 • select * from noOfCustomersInArea;  
5  
6  
7  
8  
9  
10  
11
```

Below the query editor, the "Result Grid" is displayed, showing the data inserted by the previous query:

areaName	totalNumber
Business Bay, Dubai	5
Academic City, Dubai	1
Internet City, Dubai	2

The result grid also includes a "Filter Rows" search bar and an "Export" button.

Trigger to update table noOfCustomerInArea after every insert of customer :

```
Query 1
delimiter |
create trigger update_anum
After insert on customer
for each row
begin
    if new.address is not null then
        update noOfCustomersInArea
        set totalNumber = totalNumber + 1
        where areaName = new.address;
    end if;
end |
delimiter ;
```

After Inserting new Customers :

```
Query 1
insert into customer values ('Rohan',556224421,'Business Bay, Dubai', 010);
insert into customer values ('Chris',0554443424,'Academic City, Dubai', 011);
```

Query 1

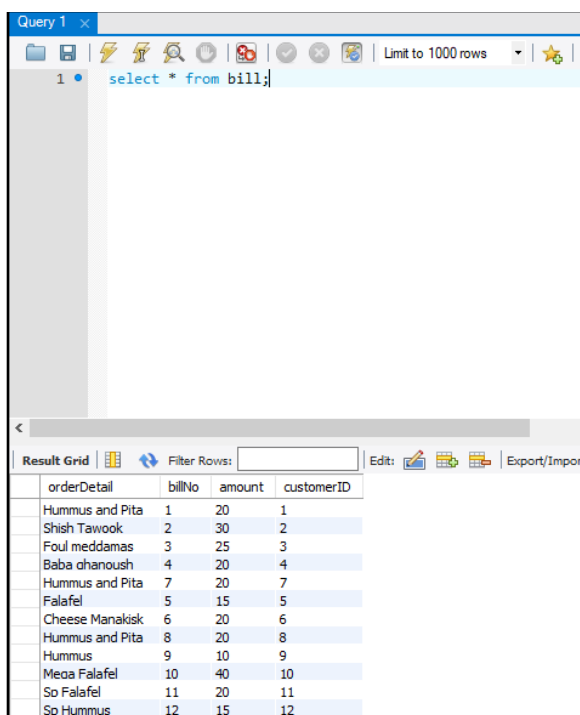

```
select * from noOfCustomersInArea;
```

130% 35:2

Result Grid

areaName	totalNumber
Business Bay, Dubai	6
Academic City, Dubai	2
Internet City, Dubai	2

Procedure to give Discount on all Customer bills eg: 2dhs discount on all bills :

The screenshot shows a database query tool interface. At the top, there's a toolbar with various icons and a 'Limit to 1000 rows' dropdown. Below the toolbar, a query editor contains the text 'select * from bill;'. At the bottom, a 'Result Grid' tab is active, displaying a table with four columns: 'orderDetail', 'billNo', 'amount', and 'customerID'. The table contains 12 rows of data, each representing a different food item and its associated bill number, amount, and customer ID.

orderDetail	billNo	amount	customerID
Hummus and Pita	1	20	1
Shish Tawook	2	30	2
Foul meddamas	3	25	3
Baba dhanoush	4	20	4
Hummus and Pita	7	20	7
Falafel	5	15	5
Cheese Manakisk	6	20	6
Hummus and Pita	8	20	8
Hummus	9	10	9
Meqa Falafel	10	40	10
So Falafel	11	20	11
So Hummus	12	15	12

After creation and calling Procedure :

Query 1

```

1 delimiter |
2 create procedure giveDiscount (in inp double)
3 begin
4     declare done int default 0;
5     declare bid int;
6     declare amnt int;
7     declare billrec cursor for select billNo, amount from bill;
8     declare continue handler for not found set done = 1;
9     open billrec;
10    repeat
11        fetch billrec into bid, amnt;
12        update bill
13            set amount = amount - inp
14            where billNo = bid;
15    until done
16    end repeat;
17 end |
18 delimiter ;
19 call giveDiscount(2);
20 select * from bill;

```

Result Grid

orderDetail	billNo	amount	customerID
Hummus and Pita	1	18	1
Shish Tawook	2	28	2
Foul meddamas	3	23	3
Baba dhanoush	4	18	4
Hummus and Pita	7	18	7
Falafel	5	13	5
Cheese Manakisk	6	18	6
Hummus and Pita	8	18	8
Hummus	9	8	9
Mesa Falafel	10	38	10
So Falafel	11	18	11
So Hummus	12	11	12

Procedure to update the total cashed in amount by a particular cashier in the totalCashier table :

Creation of totalCashier table :

Query 1

```

1 create table totalCashier (name varchar(50), totalAmount int);
2 insert into totalCashier values('Abdella Rehman', 55);
3 insert into totalCashier values('Ramun Singh', 115);
4
5 select * from totalCashier;
6

```

Result Grid

name	totalAmount
Abdella Rehman	55
Ramu Singh	115

Status of tables after few insertions :

Query 1 x

```
1 • select * from bill;
2 • select * from cashier;
```

Result Grid | Filter Rows: | Edit:

	orderDetail	billNo	amount	customerID
	Hummus and Pita	1	18	1
	Shish Tawook	2	28	2
	Foul meddamas	3	23	3
	Baba ohanoush	4	18	4
	Hummus and Pita	7	18	7
	Falafel	5	13	5
	Cheese Manakisk	6	18	6
	Hummus and Pita	8	18	8
	Hummus	9	8	9
	Mega Falafel	10	38	10
	So Falafel	11	18	11
	So Hummus	12	11	12

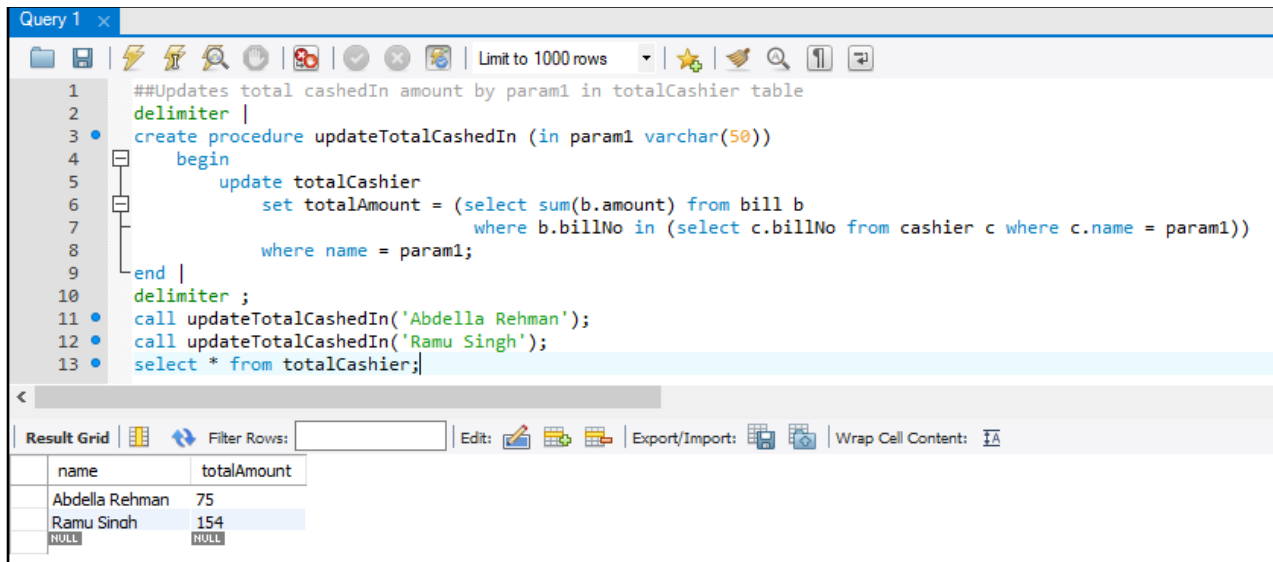

Query 1 x

```
1 • select * from bill;
2 • select * from cashier;
```

Result Grid | Filter Rows: | Edit:

	billNo	name	transactionID
6		Abdella Rehman	1
2		Ramu Sindh	2
3		Ramu Sindh	3
1		Abdella Rehman	4
4		Ramu Sindh	5
5		Abdella Rehman	6
7		Ramu Sindh	7
8		Ramu Sindh	8
9		Abdella Rehman	9
10		Ramu Sindh	10
11		Abdella Rehman	11
12		Ramu Sindh	12
	NULL	NULL	NULL

After creating and calling Procedure ;

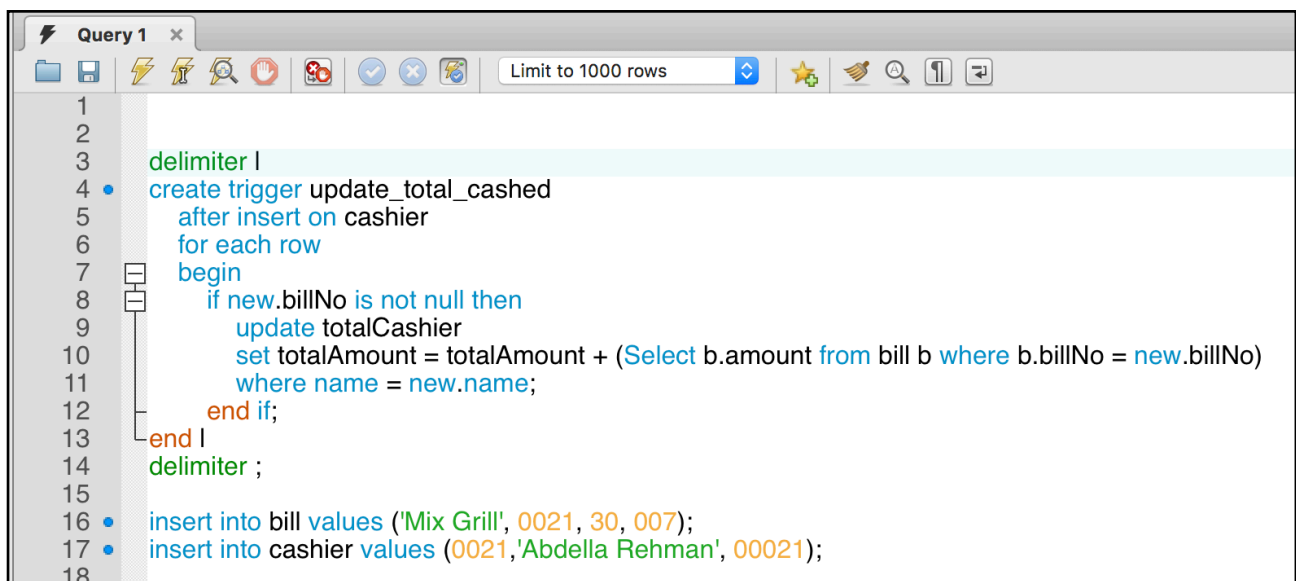

The screenshot shows a SQL query window titled "Query 1" with the following code:

```
1  ##Updates total cashedIn amount by param1 in totalCashier table
2  delimiter |
3  create procedure updateTotalCashedIn (in param1 varchar(50))
4  begin
5      update totalCashier
6      set totalAmount = (select sum(b.amount) from bill b
7                          where b.billNo in (select c.billNo from cashier c where c.name = param1))
8      where name = param1;
9  end |
10 delimiter ;
11 call updateTotalCashedIn('Abdella Rehman');
12 call updateTotalCashedIn('Ramu Singh');
13 select * from totalCashier;
```

Below the code, the "Result Grid" shows the output of the query:

name	totalAmount
Abdella Rehman	75
Ramu Singh	154
NULL	NULL

Trigger to update the total cashed in amount by all the cashiers in the totalCashier table whenever a new bill is generated and added in the cashier register table :

The screenshot shows a SQL query window titled "Query 1" with the following code:

```
1
2
3  delimiter |
4  create trigger update_total_cashed
5  after insert on cashier
6  for each row
7  begin
8      if new.billNo is not null then
9          update totalCashier
10         set totalAmount = totalAmount + (Select b.amount from bill b where b.billNo = new.billNo)
11         where name = new.name;
12     end if;
13 end |
14 delimiter ;
15
16 insert into bill values ('Mix Grill', 0021, 30, 007);
17 insert into cashier values (0021,'Abdella Rehman', 00021);
18
```

Values updated in table totalCashier;
